Specifically—2. In *Rom. antiq.*: (a) A division of the people (originally so called, probably, with reference to the approximate number of its members, though there was no fixed limit), instituted by Servius Tullius, formed with reference to taxation and to the election of magistrates and enactment of laws. All the citizens were divided into classes according to their wealth, and each of the classes was divided into from 10 to 40 senior and junior centuries, according to age. In all 193 or 194. Each century had one vote in the *comitia centuriata*, the wealthier classes voting first and generally controlling the others. (b) A subdivision of the legion, corresponding to a modern military company of infantry, and consisting nominally of a hundred men. Prior to the rule of Marius the century was half of a manipulus, and contained normally 100 men, each century having in addition 20 light-armed troops. After the military reform of Marius the old distinctions of arms in the legion were abolished; the century was still the half

of the maniple, but its normal quota of men was increased. Under the empire the regular force of the century was 110 men. See *legion*.

(c) An allotment of land of varying size; especially, the area of land allotted to soldiers in a conquered country.—3. A period of one hundred years, reckoned from any starting-point: as, a *century* of national independence; a *century* of oppression. Specifically, one of a number of hundred-year periods, reckoned either forward or backward from some recognized era. Thus the *first century* of the Christian era began with the year A. D. 1 and extended to the end of the year 100; the *third century* began with 201 and ended with 300; and the *eighteenth century* began with 1701 and ended with 1800, the year completing the hundred-year period in each instance giving name to the century. When used absolutely, without explanatory adjunct of any kind, the centuries of the Christian era are always meant. The centuries before Christ are reckoned backward in their order from the Christian era, and those after Christ are reckoned forward: as, the *fourth century* B. C. (from 301 B. C. backward to 400).

One crash, the death-hymn of the perfect tree,  
Declares the close of its green century.

Now that the extended study of comparative anatomy and embryonic development is largely applied to the elucidation of the human structure, it is very desirable that descriptive terms should be sought which may without ambiguity indicate position and relation in the organism at once in man and [other] animals. Such terms as *cephalic* and *caudad*, dorsal and ventral, are of this class, and ought, whenever this may be done consistently with sufficient clearness of description, to take the place of those which are only applicable to the peculiar attitude of the human body.

It is accomplished in various ways: by the transfer of members from the locomotive to the cephalic series; by participation of anterior locomotive organs in cephalic functions; by increased abbreviation, condensation, and perfection of structure anteriorly, with the opposite qualifications posteriorly; or by the uprising of the cephalic end, till at last the body becomes vertical.

It differs from the rest of the sheath of the bill in texture, and usually shows a plain line of demarcation. When such a structure is present, the nostrils are always pierced in its substance, or at least open at its edge. When feathered, as in sundry parrots, it appears to be wanting, but its presence is recognized by the opening of the nostrils among the feathers which grow upon it. (b) A bare space about the base of the upper mandible, or a fleshy prominence in that situation, or a distinct part of the covering of the upper mandible, though of the same texture as the rest.

The little brain or hind-brain of a vertebrate animal; a lobe of the brain developed on the dorsal side of the cerebrospinal axis, between the corpora quadrigemina in front and the medulla oblongata behind, and forming part of the roof of the fourth ventricle. The pons Varolii is the corresponding ventral portion of the cerebrospinal axis, and these two parts together are sometimes called the *encephalon*. In man the cerebellum is a well-developed mass, having an average weight of about 5½ ounces, occupying the inferior occipital fossa, and separated from the posterior portions of the cerebral hemispheres above by the tentorium. A median portion or vermis and two lateral hemispheres are distinguished, and these are divided by transverse clefts into thin, closely packed laminae. The cerebellum has three pairs of peduncles by which it is connected with the rest of the brain: the superior peduncles, which join it with the cerebrum; the middle peduncles, which pass down on either side to form the pons Varolii; and the inferior peduncles or restiform bodies, which connect it with the medulla oblongata. The surface of the laminae is of gray matter, while the interior is white, so that a section at right angles to the lamellae presents a foliaceous appearance, which has received the name of *arbor-vitæ*. There are other masses of gray matter within, namely, the corpus dentatum, nucleus emboliformis, nucleus globosus, and nucleus fastigii. (See *corpus* and *nucleus*.) The cerebellum seems to be principally concerned with the coordination of voluntary movements. See cuts under *brain* and *corpus*. 2. Same as *corpus dentatum*, (a) (which see, under *corpus*). — *Great horizontal fissure of the cerebellum*, a continuous fissure which separates the cerebellum into upper and lower portions. It begins in front at the middle peduncles, and extends around the outer and posterior border of each hemisphere. — *Incisura cerebelli anterior*, the anterior median notch of the cerebellum, into which the corpora quadrigemina are received. — *Incisura cerebelli posterior*, the median notch on the posterior outline of the cerebellum, formed by the projection of the cerebellar hemispheres beyond the vermis. — *Ventricle of the cerebellum*, the fourth ventricle or epicrue, a space between the medulla and pons in front and the cerebellum behind.

Pertaining to the anterior or preoral ganglia of the nervous system in invertebrate animals, regarded as the analogue or homologue of the vertebrate brain. These ganglia are commonly connected with the rest of the nervous system by an esophageal ring, or commissural fibers encircling the anterior part of the alimentary canal. See *esophageal ring*, under *esophageal*. — *Cerebral carotid artery*. Same as *internal carotid*. See *carotid*, *n.* — *Cerebral ganglia*, in any invertebrate, ganglia of the nervous system situated in the head, or a part of the body considered as the head. — *Cerebral hemisphere*, one of the two lateral halves forming the prosencephalon, or cerebrum in its most restricted sense. In man the cerebral hemispheres are highly developed, overlapping the cerebellum behind and the olfactory lobes in front, and the surface is highly convoluted with gyri and sulci. Each hemisphere is primarily divided into frontal, parietal, temporosphenoidal, and occipital lobes. The two hemispheres are connected with each other by the corpus callosum or great white commissure, and with the cerebellum by the pons below. They consist chiefly of white matter invested with gray matter, and contain ganglia of the latter in the interior. See

It is certain that books, in any language, will tend to encourage a diction too remote from the style of spoken idiom; whilst the greater solemnity and the more ceremonial costume of regular literature must often demand such a non-idiomatic diction, upon mere principles of good taste.

**Master of ceremonies**. (a) A person who regulates the forms to be observed by the company or attendants on a public occasion; specifically, an officer of the royal household of England who superintends the reception of ambassadors. (b) An officer in many European cathedrals whose business it is to see that all the ceremonies, vestments, etc., peculiar to each season and festival are observed in the choir.—**Military ceremonies**, stated military exercises, such as guard-mounting, inspections, parades, reviews, funeral escorts and honors, color escorts, etc.—**Syn.** 1. *Formal*, *Ceremony*, *Rite*, *Observance*. *Form* is the most general of these words; it is impossible to join in worship without the use of some forms, however simple; we speak of legal forms, etc. *Ceremony* is a broader word than *rite*, in that a *rite* is always solemn and either an act of religion or suggestive of it, as marriage-rites, the rites of initiation, while *ceremony* goes so far as to cover forms of politeness. A *rite* is generally a prescribed or customary form, while a *ceremony* may be improvised for an occasion: as, the ceremony of laying a corner-stone or opening a new bridge. *Observance* is primarily a compliance with a requirement, as in religion, where the word was applied to the act of compliance; as, the observance of the sabbath.

Heavy persecution shall arise

On all who in the worship persevere  
Of spirit and truth; the rest, far greater part,  
Will deem in outward rites and specious forms  
Religion satisfied. Milton, P. L., xii. 584.

Nay, my lords, ceremony was but devised at first  
To set a gloss on faint deeds, hollow welcomes,  
Recanting goodness, sorry ere 'tis shown;  
But where there is true friendship, there needs none.

Shak., T. of A., I. 2.

**cesura**, *cesura* (sē-zū'rā), *n.*; pl. *cesuras*, *cesurae* (-rāz, -rē). [= *F. cesure* = *Sp. Pg. It. cesura* = *D. caesur* = *G. cäsür* = *Dan. cæsür*, < *L. cæsura*, lit. a cutting, < *cadere*, pp. *caesus*, cut.] In *pros.*, a division made in a line by the termination of a word, especially when this coincides with a pause in delivery or recitation. Strictly, *cesura* is the division made by the termination of a word within a foot, the division occasioned by the concurrence of the end of a word with the end of a foot being called *dieresis*. This distinction of terms is not, however, generally observed in treating of modern poetry. A *masculine cesura* is one which immediately follows a syllable bearing the ictus or metrical accent; a *feminine cesura* is one which succeeds a metrically unaccented syllable. A *cesura* is called *trithemimeral*, *penthemimeral*, or *hepthemimeral*, according as it occurs in the middle of the second, third, or fourth foot. In the dactylic hexameter the *cesura* after the first of the two short syllables of the dactyl is called the *trochaic cesura* or *cesura after the trochee* (of the second, third, or fourth foot, as the case may be). In the same kind of verse a division at the end of the fourth foot is called a *bucolic cesura*, more accurately a *bucolic dieresis*. In the following examples the *cesura* is marked by a dagger (†), the *dieresis* by a parallel (||). Thus, in the lines of English heroic verse (iambic pentapody) given below there is a *dieresis* after the third foot of the first line, and a *cesura* in the fourth and third feet of the second and third lines respectively.

Before | the hills | appear'd, | or foun | tain flow'd,  
Thou with | Éter | nal Wis | dom † didst | converse,  
Wisdom | thy sis | ter, † and | with her | didst | play.

Milton, P. L., vii. 8.

A *cesura* occurs in the fourth foot of this iambic hexapody (trimeter):

To death's | bēnūm | ming ō | pūm † ās | mý ōn | lý cūre.  
Milton, S. A., l. 630.

The remaining examples show different *cesuras* in the dactylic hexameter. One of the most usual is the *penthemimeral*: as,

Naught but trá | dition rē | máins † of thé | beautiful |  
village of | Grand-Pré. Longfellow, Evangeline, Int.

The trochaic *cesura* of the third foot is also very frequent: as,

This is thé | fórest pri | méval, † Thé | múrmúring | pines  
And thé | hémlöcka. Longfellow, Evangeline, Int.

An example of the *bucolic cesura* (*dieresis*) combined (as is frequent) with the *penthemimeral* is:

We our | cōuntry | fý, † thōu, | Tityrus, | stretched In thé |  
| shādōw. Longfellow, tr. of Virgil's Eclogue, l.

The *hepthemimeral* is generally preceded by a *trithemimeral* as secondary *cesura*: as,

Bearded with | mósa, † and In | gárments | grēen, † Indis-  
| tinct In thé | twíllight. Longfellow, Evangeline, Int.

So in words of Spanish and Portuguese origin, as *chinech*, *chinchilla*, and in Russian and other Slavic words, in which the spelling *tch, tsh*, or (as in German) *tsh* is often employed for the single original Russian or Slavic character. **Chalcididae**<sup>1</sup> (kal-sid'i-dē), *n. pl.* [NL., *< Chal-*  
*cis*<sup>1</sup> (*Chalcid*) + *-idae*.] In *entom.*, a large fam-  
ily of pupivorous spiciferous hymenopterous  
insects, typified by the genus *Chalcis*, composed  
mainly of minute species most of which are  
parasitic on the larvæ or eggs of other insects.  
Some of them attack other parasites of the same or related  
families. The female chalcid, like the ichneumon-fly, de-  
posits her eggs on the larva or egg which she infests, some-  
times on the surface, sometimes beneath it, and often  
many together. The larvæ which emerge feed on the egg  
or on the soft parts of the infested larva; the latter is  
unable to complete its transformations, and eventually  
dies, when the chalcid emerges either as a perfect insect or  
as a larva, in the latter case sometimes spinning a rough  
cocoon in which to pass the pupa state. The *Chalcididae*  
in their perfect state have usually hard and often brilliant-  
ly metallic bodies, from which the typical genus, *Chalcis*,  
takes its name; the antennæ are elbowed; the ovipositor  
issues before the tip of the abdomen; the pronotum does  
not reach the tegulae; and the wings are almost devoid of  
veins. Many species are yet undescribed. Also *Chalcidæ*.

**Chalcididae**<sup>2</sup> (kal-sid'i-dē), *n. pl.* [NL., *< Chal-*

tinct lateral fold, hidden ears, very short limbs, and an elon-  
gated body. The species are tropical American. (b) By  
others the species are referred to the family *Tiuidæ*.

typical genus of the great parasitic  
family *Chalcididae*, of the order  
*Hymenoptera*. It was founded by Fa-  
bricius in 1787. The insects of this genus  
are parasites, and are characterized by their  
swollen hind thighs and sessile abdomen.  
They infest many injurious insects, and  
transform within the bodies of their hosts  
without spinning a cocoon. *Chalcis albi-*

genus *Spilochalcis*.

from it, including the substructural mounds, terraced tem-  
ples of brick, enamels, use of bright colors, and engraved  
gems. Such stone sculptures as have been found, par-

It is now generally made of silver, gilt inside; but gold chalices are not infrequent, while less costly materials have been used at all periods. Dan. *kalk* = F. *chaux* = Pr. *calz*, *caus* = Sp. Pg. *cal* = It. *calce* = Ir. Gael. *caile* = W. *caleh*, lime, *< L. calx* (*cale*-), limestone, lime, chalk; see *calx* and *calc*, and cf. *calcareous*, *causery*, etc.] 1. In *geol.*, a soft white rock, consisting almost entirely of carbonate of lime in a pulverulent or only slightly consolidated state, and readily soiling the fingers when handled. It is seen, when examined through the microscope, to be made up in large part of minute fragments of the shells of *Foraminifera*, mollusks, and echinoderms, and also of spicules of sponges. It does not exactly resemble any deep-sea deposit at present known to be in process of formation. This rock is a very important and conspicuous formation on the south coast of England (which on account of the whiteness of its cliffs is poetically styled Albion) and in the north of France. Under the city of London it has a thickness of from 600 to 800 feet. The chalk gives its name to the so-called Cretaceous formation. It has a limited distribution in other parts of the world, but the best known localities are the Paris and London basins. Chalk, being a nearly pure carbonate of lime in a pulverized condition, is an article of great commercial importance, and is used in a large number of operations. For such purposes it is crushed and levigated. One of its principal uses is for whitening walls, or whitewashing. It is not used with oil, as it has no body with that vehicle; but, on account of its being very much cheaper than lead paint, it supersedes that article to a great extent. There are many names for the various preparations of chalk, as *whiting*, *Spanish white*, *Paris white*, etc. Chalk is not a desirable material for ordinary mortar, but it is used to some extent as one of the ingredients of hydraulic cement. See *cement*, 2.

2. A piece of prepared chalk used for marking on a dark surface.—3. A point scored in a game: so called from its being recorded with chalk. [Local and prov. Eng.]

4. An account. See *to chalk up*, below.

"I tell you, we can't and won't trust you. Your drunk-dad has run up a long chalk already. Look there, I guess you know enough to count twelve;—twelve gallons he owes now." *S. Judd*, *Margaret*, I. 6.

A long chalk, a long way; many degrees. To beat one by a long chalk or long chalks is to beat him by a long way, or to excel him in a high degree: in allusion to the custom of making marks, as in a score, with chalk, or to the marking of distances by lines drawn with chalk. [Colloq.]

9. In law, an objection to a juror; the claim of a party that a certain juror shall not sit in the cause. The right of challenge is given in both civil and criminal trials, for certain reasons which are supposed to disqualify a juror to be an impartial judge. The challenge may extend either to the whole panel or body of jurors, called a challenge to the array, or only to particular jurors, called a challenge to the polls. Both of these challenges are subdivided into principal challenges (or challenges for principal cause) and challenges to the favor. A principal challenge is a challenge which alleges a fact of such a nature that, if proved, the juror is disqualified as a matter of law, without inquiring whether he is actually impartial: as, that one or more of the jury are returned at the nomination of the other party, or are nearly related to the other party. A challenge to the favor consists in the allegation by the party of a cause that might probably bias, and the raising of the question whether the juror is in fact impartial: as, a statement that a juror has already formed an opinion, or is prejudiced against the party. A peremptory challenge, allowed by statute in many jurisdictions, is a challenge of jurors, to a limited number, to be taken without showing any cause at all.

You shall not be my judge. Shak., Hen. VIII., II. 4.

touch, and contains small grains or eminences which are of a bluish-gray color in the shade, but in the light of the sun all parts of the body become of a grayish-brown or tawny color. The extraordinary faculty which the chameleon possesses of changing its color, in accordance with that of the objects by which it is surrounded or with its temper when disturbed, is due to the presence of clear or pigment-bearing contractile cells placed at various depths in the skin, their contractions and dilatations being under the control of the nervous system. Its power of fasting and habit of inflating itself gave rise to the fable that it lives on air. It is in reality insectivorous, its tongue, which is long and covered with a viscid saliva, being darted at its prey and securing it when touched.

1. The effervescent or so-called sparkling wine made within the limits of the old province of Champagne in northeastern France, chiefly in the region about Reims, Épernay, Avize, Ay, and Pierry, in the department of Marne. The vineyards are all situated within a district about twenty miles long, from Reims on the north to Vertus on the south, and are generally classed as "of the Hill" (*montagne*) and "of the River," namely, along the Marne; but great quantities of new wine are brought from other regions, and each manufacturer makes a mixture or blend according to his own system, to produce the brand of wine known by his name. The effervescence is artificially produced, and is of the nature of an arrested or incomplete fermentation. The greater or less sweetness of the wine is produced by the addition of a liqueur consisting of sugar-candy dissolved in old wine; the different degrees of sweetness are indicated by the terms *sec*, 'dry', *doux*, 'sweet', and *brut*, which last term, denoting originally the new or unmanipulated wine, is now used for the manufactured wines having from 1 to 3 per cent. of liqueur. The sweeter wines are generally the more effervescent.

As is the wit it gives, the gay *Champagne*.  
Thomson, The Seasons, Autumn.

2. Effervescent wine, wherever made: as, Swiss *champagne*; California *champagne*.—*Champagne brandies*, the French brandies most in repute of the cognac class. These are, in general, classified as *grandes champagnes* and *finer champagnes*. The *grandes champagnes* are distilled from the wine produced in a level district called Champagne, in the department of Charente, west of Angoulême and south of Cognac. The *finer champagnes* are the product of a blending of the brandies produced in this and neighboring regions of southwestern France with alcohols derived from grain or from beetroots, the two kinds of alcohol giving rise to distinct flavors in the brandy. An inferior grade, known as *petite champagne*, is made from grapes grown in the southern

part of the district.—*Champagne rosé*, champagne having a slightly pink or ruddy tint. This color is usually produced by the addition of a little red wine.—*Still champagne*, properly, non-effervescent wine made in Champagne, of which the best-known is *sillery sec*; improperly, slightly effervescent champagne, as distinguished from the *grand mousseux* or frothing variety.—*Tisane de Champagne*. See *tisane*.

Images of Buddha are made of its wood, which is olive-colored or dark-brown and often beautifully mottled, takes a fine polish, and is much prized for furniture. Its flowers are of a beautiful golden color and very fragrant, their perfume being much celebrated in Hindu poetry. They are worn in the hair by the native women.

Later suggested by Dana as the name of a division of the superficial (Post-tertiary) deposits of northeastern North America, connected in origin, according to the prevalent glacial theories (see *glacial*), with the melting of the great ice-sheet which once extended over that region. This application of the term has become general, but it is without the sanction of priority, and there is a disposition at present to abandon it in favor of the earlier meaning.

**chancel**, *L. cancelli*, pl., a grating, latticework: see *cancel*.] 1. *Eccles.*, the inclosed space in a church surrounding the altar, and railed off from the choir; the sanctuary. In small churches having no separate choir the altar-rails (and in some churches the screen or latticework) divide the chancel immediately from the body of the church. In a wider sense the words *chancel* and *choir* are sometimes used to include both the sanctuary and the choir proper. In Greek churches the *bema* answers to the chancel or sanctuary, and the *iconostasis* (as the choir does not intervene between sanctuary and nave) corresponds in some measure to both altar-rails and rood-screen, to the former as separating the altar from the rest of the church, and to the latter as constituting a marked boundary to the nave.

2. An inclosed space railed off in courts of judicature.

**chancellor**, *n.* An obsolete form of *chancellor*. **chanceless** (*chans'les*), *a.* [*< chance + -less.*] Without chance or opportunity; hopeless; unavailing: as, a *chanceless* struggle. [Rare.]

**chancellor** (*chân'sel-qr*), *n.* [*< ME. chancellor, chancelier, chausnelier* (always with one *l*), *< OF. chancelier, -lier, F. chancelier = Pr. cancellier, chancelier = Cat. caceiler = OSp. canceller, canceller, Sp. cancelario = Pg. canceller, cancellario = It. cancelliere = D. kanselier = MLG. kenselere = OHG. chancilari, chenzilari, MHG. kancelere, G. kansler = Dan. Sw. kansler = Icel. kansellari, kansleri = Russ. kansleru, < ML. cancellarius, a chancellor, orig. (LL.) an officer in charge of records, who stood at the latticed railing inclosing the judgment-seat, and acted as an intermediary between the suitors and the judge; < *L. cancelli*, a latticed railing: see *cancel* and *cancel*, and cf. *chancery*.] 1. Originally, under the later Roman emperors, a doorkeeper or usher, who stood at the latticed railing inclosing the judgment-seat, to keep off the crowd and to introduce such persons as were entitled to pass inside. Later and naturally he became a sort of intermediary between petitioners and the judges, and arranged about their business. In the Eastern Empire, the Roman-German empire, and the kingdoms established on the ruins of the Roman empire, this intermediary doorkeeper became a notary or scribe on whom devolved the duty of preparing and sealing all important documents, such as charters, letters, and other official writings of the crown; hence he became keeper of the great seal, and in consequence of the influence of his position his office came to be one of the most important. From the Roman empire the ecclesiastical court at Rome introduced the office, and the chancery at the Vatican was repeated throughout the several bishoprics, where each diocese, and frequently each of the great monastic houses, had its chancellor. Hence—2. A secretary; a notary.*

One Gilbert Peck, his [the Duke of Buckingham's] chancellor. *Shak.*, *Hen. VIII.*, l. 1.

3. In Great Britain: (a) The highest judicial officer of the crown, law adviser of the ministry, and keeper of the great seal: more fully designated *lord high chancellor*. He is a cabinet minister and privy councillor by virtue of his office, and prolocutor of the House of Lords by prescription, and ranks next after the princes of the blood and the Archbishop of Canterbury. The writs for the convocation of Parliament are issued by him. To him belongs the appointment of all justices of the peace, and he is the patron of all livings of the crown under the value of twenty marks in the king's books; he is keeper of the sovereign's conscience, visitor of all hospitals and colleges founded by the king, guardian of all charitable uses, and judge of the High Court of Chancery, now called the Chancery Division of the Supreme Court. There is also a lord high chancellor in Ireland at the head of the equity system of that country, and Scotland had a chancellor until the treaty of union with England in 1707. (b) An officer, officially styled *chancellor of the duchy of Lancaster*, who presides in person or by deputy over the courts of law and equity in the duchy of Lancaster. He is usually a cabinet minister, and seldom a lawyer. (c) The finance minister of the British government, more fully styled *chancellor of the exchequer*. He is invariably a member of the House of Commons (that division of the legislature having the sole right of laying taxes and originating money bills) and also of the cabinet. The chancellor of the exchequer was formerly a judge *ex officio* in the equity department of the Court of Exchequer, taking precedence of all the barons; but when the equitable jurisdiction of this court was transferred by 5 Vict. v. to the Court of Chancery his judicial functions became obsolete. (d) In the jury system of Scotland, the preses or foreman of a jury, who announces the verdict when it is a verbal one, and who, when it is in writing, hands it in and indorses it, in the name of the jury, along with the clerk of the court.—4. In France: (a) The chief officer of the crown, charged with the custody of the great seal, the administration of justice, and the duty of presiding over the councils of the king. The

office was abolished in 1790, revived in name by Napoleon I., and finally abolished in 1848.

(b) The chief officer of the palace of a queen or prince. (c) A secretary, especially of an embassy or a consulate.—5. In the new German empire, the president of the Federal Council, who is also charged with the supreme direction, under the emperor, of all imperial affairs.—6. The chief officer, next to the honorary head, of a military or honorable order, who guards its seal, administers its property, and preserves its records: as, the *chancellor* of the Order of the Garter.—7. *Eccles.*: (a) An officer learned in canon law, who acts as vicar-general to a bishop, holds his courts, and directs and advises him in all matters of ecclesiastical law, and is the keeper of his seals. More fully styled *chancellor of a bishop* or of a *diocese*. (b) An officer belonging to a cathedral, who arranges the celebration of religious services, hears lessons, lectures in theology, writes letters of the chapter, applies the seal, keeps the books, etc.—8. The titular head of a university, from whom all degrees are supposed to emanate. The chancellor was originally the notary of the chapter of the cathedral. But nobody could preach without the authorization of the bishop; and the pope as the chief of the bishops undertook to regulate this authorization. He made the chancellors of certain cathedrals his deputies for this purpose, and thus they alone could grant the degree of master of theology, the highest of the university, which carried with it the right to preach. The chancellors seldom took an active part in the government of the university. In Great Britain the office is now a merely honorary one, and is usually held by a nobleman or some statesman of eminence. The duties of the chancellor of Oxford or Cambridge are usually discharged by a vice-chancellor. There is an officer with similar functions in several of the colleges of the United States.

Milton, P. R., II. 290.

Specifically—(a) A melody composed in the Ambrosian or Gregorian style, following one of the ecclesiastical modes, having often a note for each syllable, and without a strict rhythmic structure: sometimes called a *tone*; when used in contrapuntal composition, called a *canto fermo*. (b) A Gregorian melody, usually of ancient origin, intended to be used with a prose text in several verses, several syllables in each verse being recited or intoned upon a single note. A Gregorian chant of this kind has five parts: the intonation, the first dominant or reciting-note, the mediation, the second dominant or reciting-note, and the ending or cadence. (c) A short composition in seven measures, the first and fourth of which contain but one note, whose time-value may be extended at will so as to accompany several syllables or words, while the remaining measures are sung in strict rhythm: commonly called an *Anglican chant*, because most extensively used in the services of the Anglican Church for the canticles and the psalms. An Anglican chant consists of two parts, the first of three and the second of four measures; each half begins with a reciting-note and ends with a cadence; the first cadence is also called the *mediation*. A *double chant* is equal in length to two typical or single chants, that is, contains fourteen measures, four reciting-notes, etc. The distribution of the words of a text for use with a chant is called *pointing* (which see). The Anglican chant is probably a modernized form of the Gregorian, without an intonation, having the mediation and cadence made strictly rhythmic, and following the modern ideas of tonality and harmony. Early in the history of English law, the chancellors established the rule that informalities and illegalities which by the common law would invalidate a private trust should not be allowed to defeat a public charity, and that therefore chancery should intervene to prevent the heirs or next of kin from defeating such a gift, should appoint a trustee if none existed, and, if any of the directions of the founder were impracticable, should supply others approximate thereto. The most familiar application of the rule is in the doctrine that the prohibition against perpetuities does not affect a charity. (See *perpetuity*.)

The question what constitutes a charity within this rule has been the subject of much litigation.—**Brothers of Charity**. = *Syn. 1*. Punish, *Chasten*, *Chastise*. To *punish* is primarily and chiefly to inflict pain upon, as a retribution for misdeeds, the notion of improving the offender being absent or quite subordinate. *Chasten*, on the other hand, implies that the reformation of the offender is the aim of the punishment inflicted. The word is not now often used of human acts; it is a biblical word for the providential discipline of man: as, "Whom the Lord loveth he *chasteneth*" (Heb. xii. 6); and such expressions as "the *chastening* influence of sorrow" are in use. *Chastise* is a dignified word for corporal punishment, combining in nearly equal degrees the notions of desert and correction.

It. *casupola*, a shanty), dim. of L. *casa*, a house: see *casa*. Cf. *casula* and *cassock*, of the same ult. origin.] Eccles., a sleeveless vestment, originally circular in outline, but in medieval and modern use of an elliptical shape, or modified from this so as to be nearly rectangular, and provided with an aperture in the center through which to pass the head. It is worn so as to fall in front and at the back of the wearer to an equal or nearly equal distance, showing only one of its halves at a time. The chasuble is the principal vestment worn by a priest when celebrating the mass or holy communion, and is put on over the alb. It is held to represent the seamless coat of Christ, or charity symbolized by it. The material is usually rich stuff—silk, brocade, or velvet. In its oldest form it was very full and long, reaching nearly to the feet. The medieval or elliptical form, which is sometimes worn in Roman Catholic churches, reaches below the knees, and is generally ornamented with a Y-cross. The shape common-

ly worn in the Roman Catholic Church, however, does not reach much below the hips, and is nearly rectangular at the back, the part which falls in front being cut away at the sides so as not to impede the movement of the arms, and the two parts are frequently united merely by straps at the shoulders. The chasuble generally has a pillar or vertical stripe at the front, a Y-cross or Latin cross on the back, or on both front and back, and sometimes an edging on both sides. These ornaments are added in a different material with gold or other embroidery, and are known as the *orphreys* of the chasuble. Among the different names of the chasuble, *penula*, identifying it with the ancient Roman garment of that name, is probably the oldest. The same word occurs also in various Greek forms. It is translated "cloak" in 2 Tim. iv. 13, and is the accepted name for the chasuble in the Greek Church, generally in the form *phelonion*. The name *plaveta* has also been in use from early times, and is still the term preferred in the official use of the Roman Catholic Church. The *amphibatus*, worn at one time in Gaul, seems to have been similar to or identical with the chasuble. In England the name *vestment* was in use at the time of the Reformation, both for the chasuble alone and for the chasuble with its subsidiary vestments or adjuncts, the stole, amice, and maniple. The use of the chasuble in Anglican churches continued long after the Reformation, and is maintained by certain of them (on authority claimed from the Ornaments rubric) at the present day. It is also worn in the Greek Church. See *ornament*.

3. pl. A game played with twenty-four pieces or men on a board divided into sixty-four checks or squares. Each of the two players is provided with twelve pieces, which are placed on alternate squares on the first three rows on one of two opposite sides of the board. The men are moved forward diagonally to the right or left one square at a time, or over an opposing piece if there is an empty space beyond it on the same diagonal; in the latter case the man thus "jumped" is "taken"—that is, removed from the board. Two or more pieces can be taken at once if similarly exposed, with one intervening empty square between each pair into which the adversary can "jump." The object of each player is to capture all his opponent's men, or to hem them in so that they cannot move. When a player succeeds in moving a piece to the further end of the board (the crown-head or king-row), that piece is crowned or becomes a "king," and has the power to move or capture diagonally backward or forward. In Polish checkers there are one hundred squares on the board, and forty counters; the men can move in taking either backward or forward, and kings can move the whole length of the board on the diagonals when no pieces intervene. Also called *draughts*.

The curd or casein of milk, coagulated by rennet or some acid, separated from the serum or whey, and pressed in a vat, hoop, or mold. All the acids separate the cheese from the whey; neutral salts, and likewise all earthy and metallic salts, produce the same effect; but rennet, which is made by macerating in water a piece of the last stomach of a calf, salted and dried for this purpose, is most efficient. The flowers of the *Galium verum*, or yellow lady's-bed-straw, and the juice of the fig-tree very readily coagulate milk. There are many kinds of cheese, which differ from one another according to the quality of the milk employed and the mode of preparation. *Soft cheeses*, such as *cream-cheese*, *Bath* and *Yorkshire cheese*, will not keep long. *Hard cheeses*, as *Cheshire*, *Gloucester*, *Cheddar*, *Parmesan*, and *Dutch*, can be kept a long time. There is also an intermediate class, as *Gruyère*, *Stilton*, etc. Cheese is composed of from 30 to 60 per cent. of water, 20 to 35 per cent. of casein, 30 to 40 per cent. of fat, and 4 to 6 per cent. of mineral matter.

In Scotland lovage-seeds are also added.—*Slipcoat cheese*, a rich variety of cheese made from milk

The *Testudinata* or shield-reptiles; the turtles and tortoises; an order of *Reptilia*, in which the body is inclosed in a shell consisting of a carapace and a plastron, from between which the head, tail, and four limbs protrude. These animals have the bones of the skull united to such a degree that the quadrates and pterygoids form part of the same mass as the rest; there are no teeth, the jaws being incased in horn and forming a beak; the eyes are provided with eyelids; and a sacrum is developed. In consequence of the formation of the shell, the cervical and caudal regions are the only movable parts of the spinal column; the dorsal vertebrae are devoid of transverse processes; the ribs are not

movable upon the vertebrae; and the union of the vertebrae and ribs by means of superficial bony plates almost always forms the carapace or upper shell, the lower shell or plastron being composed of dermal bones, usually 9 in number, 1 median, and 4 lateral and paired. Tortoise-shell is the peculiar epidermal or exoskeletal integument of the bony case. The lungs extend into the abdominal cavity with the other viscera. The *Chelonis* are generally sluggish, cold-blooded animals, very tenacious of life, and able to pass

long periods without food. Some, however, are quite active. They are oviparous. Most of the species are carnivorous and predatory, but the true land-tortoises are mainly herbivorous. There are over 200 species, among them a few gigantic ones, as the tortoises of the Galapagos and Mascarene islands: one of the fossil species is said to have been about 20 feet long. The living genera are very numerous. The *Chelonia* are variously subdivided. They were formerly generally distributed among four families, the club-footed land-tortoises, the related fresh-water tortoises, the soft tortoises, and the sea-turtles. Huxley called these four groups *Testudinæ*, *Emyda*, *Trionychidae*, and *Euereta*. These groups have, however, been long discarded, and the species are now segregated among many families which have been variously combined. Most of the species of the southern hemisphere belong to a peculiar old-fashioned group, the pleurodirous, while those of the northern are cryptodirous. Also *Chelonides*, *Chelonii*.

The family contains predatory species, such as *Chelyetes parasitivorax*, *C. heteropalpus*, etc., which it has been shown are strictly parasitic, although with a form of parasitism not contemplated in Van Beneden's classification, namely, a parasitism beneficial to the host, as the guest lives upon other parasites which are injurious to the host. *Michael*.

**Chemical** (kem'i-kal), *a.* and *n.* [Earlier *chymical*; *< chemic* + *-al*. See *chemistry*.] 1. *a.* 1. Pertaining to chemistry: as, a *chemical* experiment. — 2. Pertaining to the phenomena with which chemistry deals and to the laws by which they are regulated; accordant with the laws of chemistry.

Not only do worms aid indirectly in the *chemical* disintegration of rocks, but there is good reason to believe that they likewise act in a direct and mechanical manner on the smaller particles. *Darwin*, *Vegetable Mould*, p. 246.

Also *chemic*.

**Chemical acetication**. See *acetication*. — **Chemical action**. See *action*. — **Chemical affinity**, **elective affinity**, names formerly used for chemical force, and implying a property inherent in atoms of selecting other atoms with which to unite, or of preferring one combination to another. — **Chemical analysis**, the resolution of complex bodies into their elements. It is either qualitative or quantitative. Qualitative analysis consists in the determination of the component parts merely as respects their nature, and without regard to their relative proportions. Quantitative analysis consists in the determination of the relative proportions of the components. — **Chemical black bronze**. See *black bronze*. — **Chemical change**, as distinguished from *physical change*, a change which destroys the identity of the substance affected. A physical change is manifested without loss of identity by the substance. Thus, a mass of copper may be reduced to fine particles, drawn into wire, melted and cast into ingots or charged with electricity, without losing its identity as copper. But if copper is put into nitric acid, it dissolves and is converted into another substance, copper nitrate. The copper, in consequence, has lost its identity, and has undergone a chemical change. — **Chemical combination**, the intimate union by chemical force of two or more elements or compounds to form a new compound differing in properties from either of its constituent bodies. It differs from *mechanical mixture* in that each element of a chemical combination has a certain fixed and invariable combining proportion, whereas a mixture of substances can be made with varying amounts of its ingredients. In a mechanical mixture the particles of each of its ingredients can usually be identified and separated by mechanical means; in a chemical combination the constituents are so blended that they cannot be identified. Thus, if chlorine and hydrogen gas are mixed in any desired proportion, the chlorine in the mixture will be evident by its characteristic color and odor. But if this mechanical mixture is exposed to strong light, a chemical combination takes place rapidly between the two gases, with evolution of heat. They combine, however, only in exactly equal volumes, and if an excess of either is present it remains uncombined. In the new compound, hydrochloric acid, chlorine cannot be detected by either color or smell, nor be isolated except by chemical means. — **Chemical decomposition**, the separation by chemical force of the component parts of bodies from one another, or the resolution of bodies into their elements. — **Chemical equation**, a symbolic expression used to represent a chemical reaction. The reagents, or bodies which enter into the reaction, form the left-hand member of the equation, and the results of the reaction form the right-hand member. Thus, the fact that calcium chlorid and sodium carbonate when brought together in solution react on each other, forming calcium carbonate and sodium chlorid, is expressed by the following equation:

This is a true equation in the algebraic sense, because the value of the two members is the same. Since matter is indestructible, nothing is lost in the reaction, and the weights of calcium chlorid and sodium carbonate which reacted must be precisely the same as the combined

weights of the resultant calcium carbonate and sodium chloride.—**Chemical equivalent, extinguisher, ferment, fire-engine, etc.** See the nouns.—**Chemical force**, the force which binds together the atoms in a molecule, and causes chemical changes when dissimilar molecules are brought within the sphere of its action under proper conditions.—**Chemical formula**, a symbolic expression used to represent the composition of a substance. In the formulas now generally adopted by chemists each elementary substance is indicated by the first letter or letters of its name, called its chemical symbol; and to express the compounds of the elements, their symbols are arranged together, each denoting a single atom, and small numbers are written after a symbol and a little below (sometimes, and formerly always, above) the line, indicating how many atoms of the element exist in the compound. Thus, H means 1 atom of hydrogen; H<sub>2</sub>O means 2 atoms of hydrogen united with 1 of oxygen, forming the compound water; KHO means 1 atom of potassium (kalium), 1 of hydrogen, and 1 of oxygen, forming the compound potassium hydrate; and so on. If a number is placed at the beginning of the formula, it multiplies the entire formula like an algebraic coefficient; thus, 2H<sub>2</sub>O means 2 parts or 2 molecules of water. So, too, a small number placed after a parenthesis multiplies the portion included; thus, Ca<sub>3</sub>(PO<sub>4</sub>)<sub>2</sub> denotes 3 atoms of calcium combined with 2 equivalents of the radical PO<sub>4</sub>, forming tricalcium phosphate or bone phosphate. Chemical formulas are of two kinds, *empirical* and *rational*. An empirical formula expresses simply the relative number of atoms of the elements present; a rational formula expresses not only the relative number of atoms, but also some conception of the mode of union of the atoms, the groups of radicals contained in the substance, the class to which it belongs, etc. Thus, the empirical formula of acetic acid is C<sub>2</sub>H<sub>4</sub>O<sub>2</sub>. Its rational formula (CH<sub>3</sub>CO.OH) indicates that it may be regarded as made up of the radicals methyl (CH<sub>3</sub>), carbonyl (CO), and hydroxyl (OH), and so suggests to the chemist many of its properties and reactions. battlements, and affording means of communication between towers and bastions. In the earlier castles the system of defense adopted involved almost complete separation of each tower or post from the others, and the *chemin-de-ronde* was intercepted by each of these; this caused the loss of many fortresses, a sudden attack often shutting up the defenders in their isolated posts. The castles of the fourteenth century were free from this defect, the *chemin-de-ronde* becoming spacious and uninterrupted, so that the garrison could be massed readily at any point.

**Chemise** (shē-mēz'), *n.* [**< F. chemise, < LL. camisia, ML. camisa**, a shirt, a thin dress; see *camis*, which is the older form, with the more general sense.] 1. (b) The space between the chemise-wall and the main work which it protects, sometimes covered with a penthouse roof.—4. **chemistry** (kem'is-tri), *n.* [Also recently *chymistry*, by aphoresis for earlier *alchemy*, *alchemy*; now regarded as **< chemist + -ry**: see *chemist*, *alchemy*, and *alchemy*. Other names for the science are *chemics* and *chymy*: see these words.] The science of the different kinds of matter, and their mutual relations so far as these depend upon such difference in kind. It regards all substances as made up of atoms (see *atom*) which are indivisible and have certain unchanging properties. An elementary substance consists of atoms or groups of chemically united atoms of the same kind; a compound substance, of groups of chemically united atoms of two or more different kinds. All compound substances, and most elementary ones, consist of definite groups of chemically united atoms which are called *molecules*. Each molecule has exactly the same chemical composition and properties as the whole mass of the substance, and is the smallest mass into which the substance can be divided without losing its identity. The laws, causes, and effects of changes in the kind, and the number and arrangement, of atoms within the molecule are the subject-matter of the science. See *chemical*.—**Agricultural chemistry**. Also called *applied chemistry*.—**Theoretical chemistry**, the study of the general laws governing chemical action, and of their bearing on the theories of matter.—**Thermal chemistry**, or **thermo-chemistry**, treats of the phenomena and laws of the development and disappearance of heat induced by chemical reactions.

**chemitype** (kem'i-tip), *n.* [**< chemi(cal) + type.**] A process for obtaining casts in relief from engravings. A polished zinc plate is covered with an etching-ground, on which the design is etched with a point and bitten in with dilute aqua fortis. The etching-ground is then removed, and every particle of the acid well cleaned off. The plate is covered with filings of a fusible metal, and heated until the metal has melted and filled the engraving. When cold it is scraped away to the level of the zinc plate in such a manner that none of it remains except what has entered the engraved lines. The plate is next submitted to the action of a weak solution of muriatic acid; and, as the one of these metals is negative and the other positive, the zinc alone is eaten away by the acid, so that the fusible metal which has entered the hollows of the engraving is left in relief, and may be printed from in a press. Chemitype is particularly adapted for the production of maps.

The squares are alternately light and dark, and in beginning a game the board must be so

of each are placed a bishop, a knight, and a rook, in this order. The pieces move according to certain laws over unoccupied squares, the knight alone being free from this latter restriction (see below). The king moves one square in any direction (except into check); the queen in any direction and to any distance along the rows of squares, and also along the diagonals; the rooks or castles in any direction along the files or ranks of squares; the bishops (of which there is one on each color) in any direction along the diagonals of the color on which they are originally placed; the knights one square on one row and then two squares on the row at right angles to it (or two squares and then one) in any direction, without reference to interposing pieces; and the pawns one square ahead on the files. A piece is taken by removing it from the board and placing the capturing piece in its place. In taking, each piece makes some one of its ordinary moves, except the pawn, which takes by moving one square forward on a diagonal; the knight alone can take by jumping over an intervening piece. The object of the game is to capture the king of the opposing party; and this is effected by an attack so planned that it is impossible, either by moving the opposing king or by interposing another piece, to prevent him from being taken on the next move—that is, by placing the opposing king in a check from which he cannot escape. (See *check*<sup>1</sup>, *checkmate*, and *stalemate*.) The squares of the board are commonly numbered along the files, forward from either party, from the principal pieces placed upon them at the beginning of a game: as, the queen's rook's square (abbreviated *Q. R. sq.*), queen's rook's second square (*Q. R. 2*), etc.

*Chess* has been known to the Chinese for many centuries under a form not very unlike our own game. The board has 64 squares, is played with 16 men on each side, the two at the corners having equal power, and the next two (called horses) having a move equivalent to that of our knight. The chief differences are that the Chinese adversaries are separated by a river, over which some pieces cannot pass, while the "King" is confined to a square of nine moves only; and that the pieces are placed upon the intersections of the lines forming the board, instead of on the squares.

*Giles, Glossary of Reference, p. 38.*

The origin of the game of *chess* is lost in obscurity, a fact which has rather invited than repelled learned speculations on the subject. The invention of the pastime has been variously ascribed to the Greeks, Romans, Babylonians, Scythians, Egyptians, Jews, Persians, Chinese, Hindus, Arabians, Araucanians, Castilians, Irish, and Welsh.

See *art*. —Chinese art, the art of China; one of the chief branches of Oriental art. Chinese architecture makes extensive use of the bamboo; and its forms and methods of construction, even in brick and stone, are

largely influenced by this material. The roofs are usually tiled, and have characteristically a hollow dip, as if copied from the form of a tent. When rectangular, the lower corners are sharply turned up. Roofs in several projecting tiers, one over the other, are usual in temples and towers. The tiling of the roofs is often glazed in various colors, and the walls are frequently incrustured with porcelain tiles, and sometimes with marble slabs. The porcelain tower or *ta* of Nanking, destroyed in 1853, was a building of this nature; it was 200 feet high, had 9 stories, and was surmounted by an iron spire or finial. The *pa-lou*, or carved memorial gateway, is another feature of Chinese architecture. A peculiarity of Chinese building is the practice of beginning with the roof, which is supported on posts, and the walls are then built beneath it. Chinese drawing and painting are often of great delicacy, but show no knowledge of perspective. In the decorative branches of art, much of the work of the Chinese is of high merit. Their small bronzes, and carvings in wood and ivory, are of great technical excellence, and as makers and decorators of porcelains they are unsurpassed. They are fond of the grotesque, and are very successful in decorative treatment of it, as, for instance, in their favorite carved and painted figures of dragons and kindred fantas-

tic creations.—Chinese blue, capstan, classics, cross-bow, duck, fire, lantern, wax, white, yellow, etc. See the nouns.

II. n. 1. *sing.* and *pl.* (plural also formerly *Chinesees*). A native or natives of China; specifically, a member or members of the principal indigenous race of China proper, as distinguished from other Mongoloids, such as the Manchus, the race ruling the Chinese Empire from 1644 to 1912.

2. The language of China. It is a monosyllabic tongue, and on this ground is generally classed with the other languages of the same character in southeastern Asia, in Further India and the Himalayas, as constituting the monosyllabic family. It exists in many dialects, of which the so-called Mandarin is the leading and official one. It is composed of only about 500 words, as we should distinguish them in writing, all of them ending in a vowel-sound or in a nasal, although some of the dialects still retain final mutes, lost in Mandarin. This small body of words, however, is raised to 1,500 by differences of the tone of utterance, as rising, falling, even, abrupt, and so on. The language is without inflection, and even without distinction of parts of speech; but words are classed as "full" or "empty," according as they are used with their full meaning or as auxiliaries in forming phrases: like our *will* and *have* in "I will it," "they have it," on the one hand, and in "they will have seen it," on the other. Chinese records go back to about 2000 B. C., and the literature is immense and varied. The mode of writing is by signs that represent each a single word in one of its senses or in a certain set of senses. The signs are of ideographic or hieroglyphic origin; but the greater part of them at present are compound, and many contain a phonetic element along with an ideographic. They number in the dictionaries about 40,000; but only the smaller part of these are in current and familiar use. They are written in perpendicular columns, and the columns follow one another from right to left. The language and mode of writing have been carried to the neighboring nations that have received their culture from China, especially Japan, Corea, and Annam, and have been more or less borrowed or adopted by such nations.

*Chiromancy* traces in the markings of the palm a line of fortune and a line of life, finds proof of melancholy in the intersections on the saturnine mount, presages sorrow and death from black spots in the finger-nails, and at last, having exhausted the powers of this childish symbolism, it completes its system by details of which the absurdity is no longer relieved by even an ideal sense.

**chlamys** (klä'mis), *n.*; pl. *chlamydes* (-mi-dêz). [*L.*, < *Gr. χλαμυδ* (*χλαμυδ-*), a cloak, mantle.]

1. In *anc. Gr. costume*, a form of mantle which left both arms free, worn especially by equestrians, hunters, and travelers, and by soldiers. The *chlamys*, which was much smaller than the *himation*, consisted of an oblong piece of stuff having three straight sides and one long side curved outward. It was worn by bringing the two ends of the straight side opposite the curved side together around the neck, and fastening them with a buckle or fibula. The buckle was pulled around to the front, to either shoulder, or to the back, to suit the convenience of the wearer. The extremities of the curved side were weighted so as to hang vertically; and when the *chlamys* was caught together on one shoulder, as it was commonly worn, these hanging ends were likened to wings by the old writers. The paludamentum of the later Roman emperors was called *chlamys* by the Greeks.

The *chlamys* (in the sculptures of the Mausoleum) floating behind the Amazon on horseback adds to its simplicity a massiveness of fold and general form beyond anything to be seen in similarly floating drapery on the other elaps.

A. S. Murray,  
[Greek Sculpture,  
ture, II. 299.]

The species generally have metallic coloration, sometimes dull; some of them, including our commonest species, *Chlamys plicata*, so closely resemble a piece of caterpillar's dung that birds would not pick them from a leaf. The eggs of *C. plicata* are borne upon short peduncles, and . . . before they are protected by a coating of excrement or secretion by the female, they are greedily sought for and devoured by the males.

**chlorine** (klō'rin), *n.* [*< Gr. χλωρός*, greenish-yellow (see *chlor*), + *-ίνη*, *-ine*.] Chemical symbol, Cl; atomic weight, 35.46. An elementary gaseous substance contained in common salt, from which it is liberated by the action of sulphuric acid and manganese dioxide. Chlorine has a yellowish-green color and a peculiar smell, and irritates the nostrils very violently when inhaled, as also the trachea and lungs. It exercises a corrosive action upon organic tissues. It is not combustible, though it supports the combustion of many bodies, and indeed spontaneously burns several. In combination with other elements it forms chlorides, which serve most important uses in many manufacturing processes. It can be liquefied by cold and pressure. It is one of the most powerful bleaching agents, this property belonging to it through its strong affinity for hydrogen. Hence in the manufacture of bleaching-powder (chlorid of lime) it is used in immense quantities. When applied to moistened colored fabrics, it acts by decomposing the moisture present, the oxygen of which then destroys the coloring matter of the material. It is a valuable disinfectant when it can be conveniently applied, as in the form of chlorid of lime. See *calc. chlorata*, under *calc.* — Chlorin process, in *metal*, a process extensively used for separating gold from silver. It is based upon the fact that gold at

It is prepared by cautiously distilling together a mixture of acetone, water, and chlorid of lime or bleaching-powder. Its chief use is in medicine as an anesthetic in diseases attended with great pain, in surgical operations, and in childbirth. For this purpose its vapor is inhaled. The inhalation of chloroform first produces slight intoxication; then, frequently, slight muscular contractions, unquiescence, and dreaming; then loss of voluntary motion, consciousness, and sensibility, the patient appearing as if sound asleep; and at last, if too much is given, death by failure of the heart or respiration. When skillfully administered, in proper cases, it is a safe anesthetic. **chlorophyl, chlorophyll** (klō-rō-fl), *n.* [< NL. *chlorophyllum*, < Gr. *χλωρός*, yellowish-green, + *φύλλον* = *L. folium*, a leaf.] The green coloring matter of plants. It is this pigment which gives the color to chloroplastids. Chloroplastids occur in the green parts of all plants, and are rarely found in cells that are not exposed to the light. In some of the lower cryptogamic plants the chlorophyl permeates and colors the whole protoplasmic mass; in others the chlorophyl is restricted to specialized masses of protoplasm in the form of bands or stellate bodies. Ordinarily, however, the chlorophyl is restricted to the small lenticular or discoid masses of protoplasm embedded in the cytoplasm, known as the chloroplastids. The chloroplastids, with the aid of light, split up carbon dioxide and water, and with the evolution of some oxygen recombine their elements in a series of stages to produce starch and

other carbohydrate compounds. The chlorophyl pigment may be extracted from the plastids by alcohol and other solvents, and appears when dry as a green resin-like powder. In solution it may be separated into four portions, one of a blue-green color (cyanophyl), the other three of an orange or yellow color (carotin, *a* and *β*, and anthophyl). The change of color in leaves in autumn is due to the breaking up and various transformations of this pigment. In the etiolation or blanching of plants by exclusion of light they lose their color and finally become merged in the protoplasm, from which they are again developed by exposure to light and warmth.

A single long lash-like flagellum is produced from the center of the anterior border, the base of which is embraced by a delicate hyaline, extensible and retractile, collar-like expansion of the body-sarcod. The collar in its extended condition is infundibuliform or wineglass-shaped, and when contracted is subcylindrical or conical, exhibiting in its expanded state a distinct circulating current or cyclosis of its finely granular substance. The ingestive area is discoidal, food-substances being brought in contact with the expanded collar through the vibratory action of the flagellum. They are first carried up the outside and then down the inside of this structure with the circulating sarcod-current, and are finally received into the substance of the body anywhere within the circular area circumscribed by its base. Fecal or waste products are discharged at any point within the same discoidal space. These animalcules have a distinct spheroidal endoplast,

with a contained endoplastule and two or more contractile vesicles, usually conspicuous. They inhabit salt and fresh water, and increase by longitudinal or transverse fission, and by encystment and subdivision of the entire body into apical elements. In the ruins of Flaviopolis, in Phrygia, has been found a marble block having cylindrical wells marked with the names of different Greek measures. Of these the chenix appears to have contained 1.5 liters. This seems to have been about the capacity of the Æginetan, Boottian, and Pontic measures. The Attic chenix, however, according to various approximate statements of the relation of Attic to Roman measures, must have contained about 1 liter, or half a Babylonian kab; and this is probably the measure mentioned in the New Testament (Rev. vi. 6). In Egypt the Ptolemaic system had a chenix, which appears to have equaled 0.8 liter. The chenix of Heraclea in Italy is surmised to have been 0.7 liter.

When all the tones of the chord are not present, it is *imperfect* or *incomplete*; when the tones are so arranged that the root is not the lowest, the chord is *inverted*. Inverted chords are known by the numerals indicating the intervals between the lowest tone and the others: as, chords of the sixth, of the fourth and sixth, of the fifth and sixth, of the second, etc. The tonic or fundamental chord is the triad whose root is the tonic or key-note; the dominant or leading chord, that whose root is the dominant (fifth tone of the scale); the subdominant chord, that whose root is the subdominant (fourth tone of the scale), etc. Chords are related or relative to each other when they contain common tones. A transient chord is one used to connect two keys or tonalities, and containing tones foreign to both. An equivocal chord is one which may be resolved into different keys without changing any of its tones.

**II. n.** **1.** A believer in and follower of Jesus Christ; a member of a Christian church. This word occurs but three times in the New Testament, and then under circumstances which justify the conclusion that it was originally coined as a sneering appellation by the enemies of Christianity. The names employed by the followers of Christ in the apostolic church to designate themselves were *disciples*, *followers*, *believers*, *brethren*, and *saints*.

These bodies, at first unknown to each other, severally rejected all names but that of *Christians*, and were soon organized into a common denomination, now known collectively as the *Christian Connection*. They have no formulated creed, but are generally Unitarians in doctrine and Baptists in practice, and their government is congregational. They have a general quadrennial conference, and number about 100,000. (b) A member of a religious sect, properly designated *disciples* of

They retain many ancient customs, use the Syriac language in their liturgy, and are said now to be Monophysites.—**New Christians**, a name given to those Moors and Jews who in the fifteenth and sixteenth centuries in Spain, to avoid persecution, publicly professed conversion to Christianity and conformed to the church, while still retaining more or less attachment to their former religious faith and ritual.

An element, one of the metals, in the compact form whiter and more lustrous than iron, intensely hard, brittle, and less fusible than platinum. It oxidizes slowly in the air, but burns vividly in oxygen. Hot hydrochloric or sulphuric acid dissolves it; strong nitric acid does not affect it. Chromium does not occur native. It is found in the mineral crocoite or crocoisite (lead chromate), and as a sulphid in daubreelite; it occurs also in some meteoric iron, and the fine green color which makes the emerald valuable is believed to be due to chromium; but the most abundant ore of chromium is chromite or chrome-ironstone. Among its most important compounds are the oxid or sesquioxid ( $Cr_2O_3$ ), which occurs native in chrome-ocher and chromite. It is a dull-green powder when made artificially by reduction of the chromate, and is used extensively for imparting a green color to porcelain and enamel, and somewhat as a pigment, in the form of oxyhydroxid, under the name of *Guignet's green*. *Potassium bichromate* ( $K_2Cr_2O_7$ ) is the salt from which most salts of chromium are prepared. **chromolithography** (krō'mō-li-thog'ra-fi), *n.* [*Gr. χρώμα, color, + lithography*.] A method of producing colored lithographic pictures by the use of a number of prepared lithographic stones. The general outline and the outline of each of the tints in the picture to be reproduced are first traced, and then transferred to the first stone, or keystone, by the ordinary methods of lithography, or the design is drawn directly on the keystone. For the coarser kinds of color-printing the outlines of the design are made upon zinc or aluminium plates with pen or brush, and thence transferred to the stone. From the keystone, which bears the skeleton design, the outlines of each tint are separately transferred to as many other stones as there are colors in the picture. The first impression, taken by the printer from the keystone, gives the outlines of the picture, the second, taken from another stone, all the yellow tints, the third all the reds, and so on until all the colors needed are given. Before each successive impression the sheets are adjusted to a nicety, in order that the colors may not overlap one another. This adjustment is called the *register*. After the printing is completed the sheets are sometimes passed through an embossing-press, to give them a canvas-like surface.

**chronograph** (krōn'ō-gráf), *n.* [*< Gr. χρόνος, χρόνος, recording events (see chronography), lit. recording time, < χρόνος, time, + γράφειν, write.*] 1. A chronogram.—2. An instrument for recording the exact instant in which an event occurs. The most important instrument of this kind is the astronomical chronograph, the parts of which are: (a) a train of clockwork, regulated, not by an ordinary escapement, but in such a way as to move with a continuous and equable motion, and carry forward a sheet or ribbon of paper; (b) a pen which draws a continuous line upon the paper, and is so attached to the armature of an electromagnet that whenever the electric current is broken (or made) for an instant a jog is produced in the line drawn by the pen. The electromagnet is put into one circuit with a clock or chronograph which breaks (or makes) the circuit for an instant at every second, or other convenient interval, and also with an observing-key, which, on being pressed (at the moment the observation is taken) produces the same effect. The result is that jogs appear upon the line drawn by the pen at every second, and also every time the key is touched; and the relative distances of these jogs, which can be accurately measured, give the time of the observation correct to a fifth of a second. The name *chronograph* is also applied to various kinds of watches so contrived that when a button is pressed the second-hand stops, or one of two second-hands stops, or the second-hand leaves a dot of ink upon the dial.

3. An instrument for measuring a small interval of time. The simplest instrument of this description consists of a tuning-fork carrying at the end of one of its prongs a bit of quill, which scratches a wavy line upon a moving piece of blackened paper. At the beginning and at the end of the interval to be measured an induction-spark is made to pass through the paper close to the marking-point. Two little dots are thus made, and the number of waves and fractions of a wave between them gives the interval of time expressed in terms of the period of vibration of the fork as a unit.—*Boulegé's chronograph*, an instrument by means of which a small interval of time is determined by measuring the space described by a falling body during the interval. It is the instrument most used for obtaining initial velocities. *Bastforth's chronograph* is also used for this purpose.

a, Chrysalis of the Philenor Swallow-tail, shaded back view; b, same, lateral outline; c, Chrysalis of the Archippus Butterfly, lateral view.

In the chrysalis form the animal is in a state of rest or insensibility, and exist without nutriment for a length of time varying with the species and season. During this period an elaboration is going on in the interior of the chrysalis, giving to the organs of the future animal their proper development before it breaks its envelop.

The form of the case of the chrysalis varies with different families and orders. Those of most lepidopterous insects are inclosed in a somewhat horny membranous case, and generally of a more or less angular form, pointed at the abdominal end and sometimes at both ends. Before the caterpillar undergoes its transformation into this state it often spins for itself a silken cocoon, within which the chrysalis is concealed. In most of the *Coleoptera* the legs of the chrysalis are in distinct sheaths; in the *Lepidoptera* they are not distinct; in the locust tribe, and many other insects, the chrysalis resembles the perfect insect, and differs from the latter principally in not having the wings complete. Also called *chrysalid*, *chrysalidan*, *nymph*, *pupa*, and formerly *aurelia*.

**chrysalis-shell** (kris'-a-lis-shel), *n.* The shell of a gastropod of the genus *Pupa* or family *Pupidae*.

[*cap.*] [*NL.*] A large genus of composite plants, chiefly natives of Europe, Asia, and northern Africa. The generic name is now rarely appropriate, as only a small number have yellow flowers. The perennial chrysanthemum of the gardens, *C. Sinense* or *Indicum*, a native of China and Japan, has developed under cultivation a great diversity of handsome and remarkable varieties. It ranks as the national flower of

*Chrysanthemum frutescens.*

Japan, where special attention is paid to its cultivation and variation, and where an open 16-petaled chrysanthemum is the imperial emblem. Several other species are frequently cultivated for ornament, as *C. frutescens*, *C. roseum*, etc. The genus includes the common feverfew (*C. Parthenium*), the corn-marigold of Europe (*C. segetum*), and the whiteweed or oxeye daisy (*C. Leucanthemum*).

Such a statue was built up upon a wooden core or frame, braced and sustained by rods of metal. When the sculptor had completed his model, the flesh-surface of a cast taken from it was marked off into sections. These were separated from one another, and reproduced in ivory plates, which were eventually fastened on or fitted into the surface of the wooden core. The draperies also were divided into sections and reproduced in gold, gold of different tints often being introduced, and were fitted upon the statue like a garment. The gold por-

tions were sometimes made removable, as in the great statue of Athena by Phidias in the Parthenon at Athens; in that case they were regarded as a reserve fund available to the state in time of need.

The proportions of the whole building (the Parthenon) itself were again adjusted to the scale of the *chryselephantine* statue of Pallas Athena which it contained.

This is he that was in the church in the wilderness with the angel which spake to him in the mount Sina.

Acts vii. 38.

[What constitutes a Christian church according to the Scriptures is a question on which Christian denominations widely differ. The three principal views may be distinguished as the Roman Catholic, the Protestant ecclesiastical, and the voluntary. According to Roman Catholic theologians, the church is a visible and organic body, divinely constituted, possessing "Unity, Visibility, Indefectibility, Succession from the Apostles, Universality, and Sanctity." (Faith of Catholics, I. 9), and united to its visible head on earth, the Bishop of Rome. According to the Anglican and Protestant ecclesiastical view, the church of Christ is "a permanent visible society" (*Wordsworth* on Mat. xvi. 18), divinely compacted, governed, and equipped, and having definite ends, a definite policy, and a historic continuity. (The Church Cyclopedia.) According to the voluntary conception, a church is a society of persons professing faith in the Lord Jesus Christ as the Son of God and the Saviour of men, and organized in allegiance to him for Christian work and worship, including the administration of the sacraments which he has appointed. (*R. W. Dale*, *Manual of Congr. Principles*, Comp. West. Conf., xxxv; *Thirty-nine Art.*, xix.) The second view is held by many, perhaps a majority, in the Episcopal, Lutheran, and other hierarchical denominations; the last by a majority of those in the non-hierarchical denominations, including the Methodist, Baptist, Presbyterian, and Congregational.]—*Advocate of the church*. See the adjectives.—*Church militant*, the church on earth, as engaged in a warfare with the world, the flesh, and the devil, or the combined powers of temptation and unrighteousness: in distinction from the church triumphant in heaven.—*Church of England*, the national and established church in England; the Anglican Church in England and the British colonies, in some of which it has been disestablished. The Church of England claims continuity with that branch of the Catholic Church which existed in England before the Reformation. In the first half of the sixteenth century, under Henry VIII., the spiritual supremacy and jurisdiction of the Pope were abolished; the sovereign was declared to be the head of the church in a sense explained in the thirty-seventh of the Thirty-nine Articles; and a close union of church and state, known as the establishment of the church, took place. The clergy of the Church of England are composed of three orders, namely, bishops, who are appointed by the crown (see *congr. d'élire*, under *congr.*), priests or presbyters, and deacons. There are also two archbishops, the Archbishop of Canterbury and the Archbishop of York, the former being the primate of England. Twenty-four of the bishops and the two archbishops sit and vote in the House of Lords. Its chief ecclesiastical body is the Convocation. Thus, the Episcopal Church is established in England and Wales, the Presbyterian in Scotland, the Evangelical in Prussia, the Roman Catholic in Italy, Spain, Portugal, etc. In some countries of Europe, as France, all or many of the principal religious organizations receive state support. In the United States the church is entirely disestablished from all relations to the state.

In modern times the church banner is borne only in church processions, whether within or without the edifice.—*Church bench*, a seat or bench in the porch of a church.—*Church brief*. See *brief*, *n.*, 2 (d).—*Church burial*, burial according to the rites of the church.—*Church cadence*, in music, the cadence formed by the subdominant and the tonic chords; a plagal cadence: so called because very common in medieval church music, and still retained in "Amen."—*Church court*, a court connected with a church for hearing and deciding ecclesiastical causes; a presbytery, synod, or general assembly.—*Church judiciary*, an ecclesiastical court or body exercising judicial powers.—*Church living*, a benefice in an established church.—*Church modes*, in music, the modes or scales first authorized for church use by Bishop Ambrose in the fourth century, and by Pope Gregory the Great in the seventh century. For the *church-ale* two young men of the parish are yearly chosen by their last foregoers to be wardens, who, dividing the task, make collection among the parishioners of whatsoever provision it pleaseth them voluntarily to

Its uses were varied; indeed, it would seem to have been the public room of the parish, which could, with the consent of the churchwardens, be used for any purpose that the needs of the parish rendered necessary. For these and many other purposes, including in England some of a strictly secular character, they possess corporate powers. There are usually two churchwardens to each parish, but by custom there may be only one. By a canon of the Church of England, joint consent of minister and parish should attend the choice of churchwardens. If they cannot agree, the minister names one and the parishioners the other. In some cases the parish has a right by custom to choose both. In the United States churchwardens are always elected, but have duties similar to the above. **Ciliata** (sil-i-ä'tä), n. pl. [NL., neut. pl. of *ciliatus*, having cilia: see *ciliate*.] 1. The ciliated infusorians; a major group of *Infusoria*, as distinguished from the *Flagellata* and the *Tentaculifera*, characterized by the possession of organs of locomotion and prehension in the shape of numerous vibratile cilia, more or less completely clothing the body. The cilia are variously modified as setae, styles, or uncini, and membraniform expansions are occasionally found; but the *Ciliata* are devoid of the special supplementary lash-like appendages called flagella. They are usually asymmetrical animals of a high grade of organization in their class, the simplest of them being differentiated into an endosarc and ectosarc with an endoplastic and contractile vacuole, while most, if not all, show an oral region where food is ingested, whence an esophageal depression leads into the endosarc; and there is also, usually, an aboral or anal area through which the refuse of digestion is evacuated. The families are numerous, and have been divided by Stein into the groups *Holotricha*, *Heterotricha*, *Hypotricha*, and *Peritricha*, according to the character of the cilia and their disposition upon the body of the animal. *Paramecium* and *Vorticella* are common examples of the *Ciliata*.

In such cases the cilia have in the individual

cells precisely the same action as in the numberless microscopic animals of which they are highly characteristic, as infusorians, radiolarians, polyzoans, rotifers, and the embryonic or larval stages of very many other invertebrates. Cilia are distinguished by their permanency from the various temporary processes which resemble them, such as pseudopodia, and by their minuteness and activity from the similar but usually larger special processes known as flagella, vibracula, etc.; but the distinction is not absolute. The peculiar vibratile action of cilia is termed *ciliary motion*. See cuts under *blastocoele*, *Paramecium*, and *Volvoxella*.

The NL. name according to the Sp. would prop. be *Chinchona* (pron. chin-chō'nā), but it rarely appears in that form, being adapted in form and pron. to L. analogies.] 1. A genus of evergreen trees, of the family *Rubiaceæ*, natives of the Andes from the United States of Colombia to Bolivia, growing chiefly on the eastern slopes at an average altitude of from 5,000 to 8,000 feet. They are the source of Peruvian or cinchona bark and of quinine. There are about 40 species, but the cinchona barks of commerce are produced by about a dozen. The barks used in pharmacy are chiefly of three kinds: *loxa*, crown, or pale cinchona bark, the ordinary Peruvian bark, afforded by *C. officinalis*; *callaya* or

bian or Cartagena bark, from *C. lancifolia* and *C. cordifolia*; Pitayo bark, from *C. Pitayensis*; gray, Lima, or Huancabaco bark, from *C. Peruviana* and other species; and Cusco bark, from *C. pubescens*. The British and Dutch governments have done much to promote the cultivation of the more important species, and extensive plantations have been successfully established in the Himalayas and in Ceylon, Java, and Jamaica. Cinchona bark is most valuable as a remedy in fevers and as a general tonic; but the alkaloids obtainable from the bark have in practice largely taken the place of the bark itself. Of these the most abundant and the one in most common use is quinine. Others equally valuable are quinadin, cinchonine, and cinchonidine. The amount of alkaloids yielded by the bark is very variable, from a very small percentage to as much as 12 per cent., of which from one third to three fourths is quinine. 2. The circuits of England and Wales (of which there are seven fixed by order in Council) are now constituted as follows: the *home circuit*, or *southeastern circuit*, includes Hertford, Chelmsford, Lewes, Maidstone, Huntingdon, Cambridge, Ipswich (and Bury St. Edmunds), Guilford, and Norwich; the *midland circuit*, Bedford, Aylesbury, Derby, Leicester, Lincoln, Northampton, Nottingham, Oakham, Warwick Division, and Birmingham Division; the *northern circuit*, Carlisle, Appleby, Lancaster, Manchester, and Liverpool; the *northeastern circuit*, Durham, Newcastle, York, and Leeds; the *Oxford circuit*, Reading, Oxford, Worcester, Stafford, Shrewsbury, Hereford, Monmouth, and Gloucester; the *western circuit*, general assizes, Winchester, Devizes (alternately with Salisbury), Dorchester, Exeter, Bodmin, Taunton (alternately with Wells), and Bristol; the *North Wales circuit*, Welshpool (alternately with Newtown), Dolgelly, Carnarvon, Beaumaris, Ruthin, Mold, and Chester Castle; and *South Wales circuit*, Haverfordwest, Lampeter, Carmarthen, Swansea or Cardiff, Brecon, and Presteigne. Ireland is divided into six circuits; and Scotland, exclusive of the Lothians, is divided into three circuits, each presided over by two judges of the High Court of Judiciary, or Supreme Criminal Court. The circuits of the United States Courts of Appeals are now as follows: *first circuit*, the districts of Maine, New Hampshire, Massachusetts, and Rhode Island; *second circuit*, the districts of Vermont, Connecticut, and New York (northern, southern, eastern, and western); *third circuit*, the districts of New Jersey, Pennsylvania (eastern, middle, and western), and Delaware; *fourth circuit*, the districts of Maryland, North Carolina (eastern and western), South Carolina (eastern and western), West Virginia (northern and southern), and Virginia (eastern and western); *fifth circuit*, the districts of Georgia (northern and southern), Florida (northern and southern), Alabama (southern, northern, and middle), Mississippi (northern and southern), Louisiana (eastern and western), and Texas (eastern, western, northern, and southern); *sixth circuit*, the districts of Ohio (northern and southern), Michigan (eastern and western), Kentucky (eastern and western), and Tennessee (eastern, middle, and western); *seventh circuit*, the districts of Indiana, Illinois (northern, southern, and eastern), and Wisconsin (eastern and western); *eighth circuit*, the districts of Minnesota, Iowa (northern and southern), Missouri (eastern and western), Kansas, Arkansas (eastern and western), Nebraska, Wyoming, Colorado, North Dakota, South Dakota, New Mexico, Oklahoma (eastern and western), and Utah; *ninth circuit*, the districts of California (northern and southern), Oregon, Idaho, Nevada, Montana, Washington (eastern and western), Arizona, Alaska, (heard in San Francisco), and Hawaii.

The path, consisting of conducting substances, through which an electric current flows.

In electric lighting or power distribution, the circuit consists of the generator or dynamo, the transmission and distribution lines, and the motors or lamps; in telegraphy the earth forms part of the circuit. When the path of the current is completely made, so that the electricity is free to flow, the circuit is said to be *made*, *completed*, or *closed*; if interrupted at any point, it is *broken* or *opened*. A magnetic circuit is the path through which the magnetic flux passes: it is closed when consisting only of iron or other magnetic materials, open when containing an air-gap.

6. In *chem.*, the repeated vaporization and condensation of a substance in distillation. — 7. In *math.*, the amount of flow round a closed path or circuit; the line-integral round a closed curve of the component velocity of a fluid along the curve. — **Circulation of the blood**, the passage of the blood from the heart into the arteries, from them into the veins, and through the veins back to the heart. The blood passes from the right auricle to the right ventricle, and from the right ventricle by the pulmonary artery to the capillaries of the lungs, where it gives off carbon dioxide and takes up oxygen. From the capillaries of the lungs it returns to the heart, and flows into the left auricle through the four pulmonary veins; thence it goes to the left ventricle, and thence by the aorta to distribute itself over the body. Passing from the arteries through the capillaries into the veins, it returns to the right auricle through the superior and inferior vena cava. The blood-vessels form a continuous system without visible pores; but there is continual leakage of the blood-plasma into the tissues, as well as passage of oxygen through the walls of the vessels; and while there is some reentrance of substances from the tissues into the blood, there is also provided in the lymphatic vessels a system of drains which takes up from the tissues the leakage from the blood-vessels, changed as it is by all that it has received from and given up to the tissues. These lymphatics pour their contents into the thoracic duct, which discharges into the veins at the union of the veins from the head and neck on the left side; except that the lymphatics from the right side of the head and the right arm and shoulder empty into the veins at the corresponding point on the right side. The velocity of the circulation is greatest as it leaves the heart, diminishes as it proceeds to the capillaries, and increases as it comes back to the heart again in the great veins. It is estimated as from 15 to 20 inches per second in the aorta, on the average, and in the capillaries as .02 to .03 of an inch per second. The time for the complete circuit in man is a little less than half a minute. The tension of the blood in the human aorta is probably between 6.90 and 7.87 inches of mercury above the atmospheric pressure. It diminishes continuously in the arteries, capillaries, and veins, and in the large venous trunks near the heart, as the subclavian, becomes slightly less than the atmospheric pressure, and is called *negative*. The circulation of the blood was first correctly described and fully established by Harvey (1628); but the exact way in which the blood passed from the arteries to the veins was unknown until Malpighi discovered the capillaries (1661). In the mean time the main features of the lymphatic system had been worked out by Bartholin and others. The determination of blood pressures and velocities and the functions of the vasomotor nerves has been the work almost entirely of the present century. — **Collateral circulation**, in *physiol.*, the passage of the blood from one part to another of the same system of vessels by collateral communicating channels. It is much more frequent in the veins than in the arteries.

On the whole, we may at present conclude that increased growth first on one side, and then on the other, is a secondary effect, and that the increased turgescence of the cells, together with the extensibility of their walls, is the primary cause of the movement of circumnutation. *Darwin, Movement in Plants*, Int., p. 2.

The Cissoid of Diocles.

*MM'*, the inflexional asymptote; *ABED*, the generating circle, the center being at *C*; *BD*, a diameter of this circle.

It was invented by one Diocles, a geometer of the second century B. C., with a view to the solution of the famous problem of the duplication of the cube, or the insertion of two mean proportionals between two given straight lines. Its equation is  $x^3 = y^2(a - x)$ . In the cissoid of Diocles the generating curve is a circle; a point *A* is assumed on this circle, and a tangent *MM'* through the opposite extremity of the diameter drawn from *A*; then the property of the

curve is that if from *A* any oblique line be drawn to *MM'*, the segment of this line between the circle and its tangent is equal to the segment between *A* and the cissoid. But the name has sometimes been given in later times to all curves described in a similar manner, where the generating curve is not a circle.

curve is that if from *A* any oblique line be drawn to *MM'*, the segment of this line between the circle and its tangent is equal to the segment between *A* and the cissoid. **5. A private person, as opposed to a civil official or a soldier:** as, a police officer in citizen's dress.—**Natural-born citizen**, one who is a member of a state or nation by virtue of birth. A race; a family; a tribe; an association of persons under a chieftain; especially, such a family or tribe among the Highlanders of Scotland. The clan is a tribal form of social and political organization based upon kinship of the members. The chief features of the system are (1) the leadership of a chief, regarded as representing a common ancestor, and (2) the possession of land partly undivided as the common domain of the clan, and partly divided as the separate property of its members and their heirs, the clan being the heir of a member who dies leaving no son. It prevailed in early times in Germany and Ireland, and until recently in Scotland, and to some extent in other countries. Thus, among the Highlanders a clan consisted of the common descendants of the same progenitor, under the patriarchal control of a chief, who represented the common ancestor, and who was revered and served by the clansmen with the blind devotion of children. The clans did not, however, acknowledge the principle of primogeniture, often raising to the chieftainship a brother or an uncle of a deceased chief. The name of the clan was generally that of the original progenitor with the prefix *Mac* (son). There are few traces of this institution now remaining.

Each trained to arms since life began,  
 Owning no tie but to his clan.

**clasp-nail** (klāsp'nāl), *n.* A nail having a head with pointed spurs that sink into the wood.

\***class** (klās), *n.* [= D. *klas*, *klasse* = G. *klasse* = Dan. *klasse* = Sw. *klass*, < F. *classe* = Sp. *clase* = Pg. It. *classe*, < L. *classis*, a class or division of the people, assembly of people, the whole body of citizens called to arms, the army, the fleet, later a class or division in general, OL. *clāsis*, = (perhaps <) Gr. *κλῆσις*, a calling, summons, name, appellation, < *καλεῖν* = L. *calare*, call, proclaim: see *claim*<sup>1</sup> and *calends*. Hence *classic*, *classify*, etc.] 1. In *anc. hist.*, one of the five divisions of the Roman citizens made, according to their wealth, by Servius Tullius, for purposes of taxation: a sixth division comprised those whose possessions fell below the minimum of the census. Hence—2. An order or rank of persons; a number of persons having certain characteristics in common, as equality in rank, intellectual influence, education, property, occupation, habits of life, etc.

We are by our occupations, education, and habits of life  
divided almost into different species. Each of these *classes*  
of the human race has desires, fears, and conversation, ven-  
ations and merriment peculiar to itself. Johnson.

Nine tenths of the whole people belong to the laborious,  
industrious, and productive *classes*.

D. Webster, Speech, Pittsburg, July, 1833.

The constitution of the House of Commons tended  
greatly to promote the salutary intermixture of *classes*.  
The knight of the shire was the connecting link between  
the baron and the shopkeeper. Macaulay, Hist. Eng., I.

3. Any body of persons grouped together by particular circumstances or for particular reasons. Specifically—(a) A number of pupils in a school, or of students in a college, of the same grade or pursuing the same studies; especially, in American colleges, the students collectively who are graduated, or in accordance with the rules of the college will be graduated, in the same year. There are four college *classes*, the freshman or lowest, the sophomore, the junior, and the senior. The word was first used in this sense in American colleges in the Latin form *classis*, and was borrowed from the universities of continental Europe, where it had during the sixteenth century replaced the medieval *lectio*. (b) In the *Meth. Ch.*, one of several small companies, usually numbering about twelve members, into which each society is divided, for more effective pastoral oversight, social meeting for religious purposes, and the raising of money for church work. It ordinarily holds a weekly session called a *class-meeting*, under the charge of one of the members called a *class-leader*, whose duty it is to see every member of his class at least once a week; to give religious instruction, reproof, or comfort, as needed; to receive for the stewards of the church the contributions of the class for the support of the church; to report to the pastor any members needing special attention, as the sick, backsliders, etc.; and to report on the condition of his class to each Quarterly Conference. (c) Same as *classis*, 2. (d) In several European states, one of the graded divisions of primary electors for members of the legislative body. In Prussia the whole number of voters is divided into three *classes*, so arranged that each class pays one third of the direct tax levied. The first class is of the few wealthy, who pay the highest taxes, to the amount of one third of the whole. Each class chooses the same number of secondary electors, who elect the deputies.

4. A number of objects distinguished by common characters from all others, and regarded as a collective unit or group; a collection capable of a general definition; a kind. A *natural class* is a set of objects possessing important characters over and above those that are necessary for distinguishing them from others; but the term is applied by naturalists to groups which want this character, and which have not generally retained very long, unchanged, a place in science. See *classification*.

There is not a more singular character in the world than  
that of a thinking man. It is not merely having a suc-  
cession of ideas which lightly skim over the mind that can  
with any propriety be styled by that denomination. It is  
observing them separately and distinctly, and ranging  
them under their respective *classes*.

Melmoth, Letters of Fitzosborne.

Logicians divide propositions into certain *classes*.

Reid, Account of Aristotle, II. § 1.

Observing many individuals to agree in certain attri-  
butes, we refer them all to one *class*, and give a name to  
the *class*. Reid, Intellectual Powers, v. § 2.

[This meaning came into use about the middle of the eighteenth century. The phrase 'to be included under a class' is older than 'to be included in a class.']

5. In *nat. hist.*, a group of plants or animals next in rank above the order or superorder, and commonly formed by the union of several orders or superorders; but it may be represented by a single species. See *classification*. In zoology the class was the highest division of the animal kingdom in the Linnean system, when the word first acquired its technical zoological meaning. Linnaeus arranged animals in six *classes*: *Mammalia*, *Aves*, *Amphibia*, *Pisces*, *Insecta*, *Vermes*; the next groups below

were the orders. In the Cuvierian system a class was the first division of one of the four "great divisions" of the animal kingdom, *Vertebrata*, *Mollusca*, *Articulata*, and *Radiata*; thus Cuvier's four classes of *Vertebrata* were *Mammalia*, *Aves*, *Reptilia*, and *Pisces*. There are now recognized seven or eight subkingdoms or phyla of animals, divided into about thirty-five classes (see *animal kingdom*, under *animal*); the class being the division usually recognized next below the phylum or subkingdom, though some naturalists introduce a *superclass*, or division between the phylum and the class, as *Ichthyopoda* for the classes *Pisces* and *Amphibia*, or *Sauropsida* for the classes *Aves* and *Reptilia*. The class is always superior to the superorder, order, or suborder, and inferior to the kingdom, subkingdom, or phylum. In botany, likewise, the class is the next principal grade of divisions above the order, and in the Linnean system was the highest grade. The subclass, division, and series or group are, however, often variously intercalated as subordinate groupings between the class and the order. The subkingdom *Spermatophyta*, or seed-bearing plants, includes the two classes *Gymnospermæ* and *Angiospermæ*. The subkingdoms *Pteridophyta*, *Bryophyta*, and *Thallophyta* are variously subdivided by different writers. See these terms in the supplement.

6. In *geom.*, the degree of a locus of planes; a division of algebraical loci bearing an ordinal number showing how many planes there are incident to the locus and passing through each line of space. In the case of a plane locus, this is the number of lines in the plane incident to the locus and passing through each point in the plane. The ordinal number of the class of an algebraical surface is the number of tangent planes to the surface through each line of space. The class of an algebraical curve of double curvature is the number of osculating planes through each point of space; also, the class of a cone on which the curve lies. The class of an algebraical plane curve is the number of tangents through each point of the plane. The class of a congruence is the number of lines of the congruence passing through each point of space. The class of a complex is the class of the cone of lines of the complex passing through each point of space. The class of a cone is the class of a plane curve lying in it.—*Class cup*, a silver cup presented by a college class to the first boy born to a member of the class after graduation. [U. S.]—*Class of a manifold*. See *manifold*.

*H. Spencer*, *Man vs. State*, p. 5.

2. To place in ranks or divisions, as students that are pursuing the same studies; form into a class or classes, as in an educational institution. = *syn.* 1. *Class*, *Classify*; arrange, distribute, dispose. *Class* is the older and less precise word; it is applied to persons more often than *classify*. *Classify* is used in science rather than *class*, as being more exact.

*II. intrans.* To be arranged or *classed*. [Rare.]

**classable** (klās'-a-bl), *a.* [*class* + *-able*. Also less prop. *classible*, < *class* + *-ible*.] Capable of being *classed*.

2. A literary production of the first class or rank; specifically, in the plural, the literature of ancient Greece and Rome.

Under the tuition of Mr. Reynolds he was for some time instructed in the *classics*. *Malone*, *Sir J. Reynolds*.

A *classic* is properly a book which maintains itself by virtue of that happy coalescence of matter and style, that innate and requisite sympathy between the thought that gives life and the form that consents to every mood of grace and dignity, . . . and which is something neither ancient nor modern, always new and incapable of growing old. *Lowell*, *Among my Books*, 2d ser., p. 126.

The present practice of making the *classics* of a language the vehicle of elementary grammatical instruction cannot be too strongly condemned. When the *classics* of a language are ground into children who are incapable of appreciating them, the result is often to create a permanent disgust for literature generally.

**classification** (klās'-i-fi-kā'-shon), *n.* [= *G. klassifikation* = *D. klassifikation* = *Dan. klassifikation* = *F. classification* = *Sp. clasificación* = *Pg. classificação* = *It. classificazione*, < *NL. classificatio* (n.); < *classificare*, classify: see *classify*.] The act of forming a class or of dividing into classes; the act of grouping together those beings or things which have certain characters in common; distribution into sets, sorts, or ranks; taxonomy.

In natural history classification has been made on two principles, distinguished as the *natural* and the *artificial*: the former aiming to arrange all known plants or animals according to their resemblances, and degrees of resemblance, in the whole plan of their structure; the latter arranging them by some one or more points of resemblance or difference, as may be most convenient and easy, and without regard to other considerations. The widest divisions in zoology are called subkingdoms; subkingdoms are divided into phyla or classes, classes into orders, orders into families, families into genera, genera into species, and species into subspecies. There are also intermediate divisions, as subclasses, superorder, suborder, subfamily, etc. In botany the present tendency is to conform as nearly as possible to zoological classification, although formerly a very different system was employed. See *animal kingdom*, and *class*, 5.—**Cross-classification**, one in which the different classes are subdivided upon a common differentiating principle, so that they are not subordinated to one another. Thus, the division of the population into native and foreign, male and female, is a cross-classification. Such are the classifications of chemistry, geometry, logic, etc. Cross-classification violates a canon of Aristotelian logic.—**Hierarchical classification**, a classification in which the subdivisions of different classes are different, as was required by Aristotle. Such are the usual classifications of botany and zoology.—**Quinary or quaternary classification**. See *quinary*.

Speaking strictly, we form a class when we bring together a collection of individuals held in union by the bond of one or more points of community, and when we take care that nothing that is destitute of the point or points of community is admitted into the class: we *classify* when we arrange classes thus constructed on the principle of higher and lower, wider and narrower.

Like the pianoforte, it had a keyboard and a set of strings on a horizontal frame; but the tone was produced by the pressure of a brass "tangent" raised and

held against the string, instead of by the stroke of a hammer. This method of tone-production permitted considerable variation in force and in quality. The compass of the clavichord was originally limited to a few tones in diatonic succession, and the advance to a full chromatic scale was made gradually. Tuning in equal temperament was not established until toward the middle of the eighteenth century.

In man and sundry quadrupeds there are complete clavicles or collar-bones, each joined at one end to the scapula or shoulder-bone, and at the other to the sternum or breast-bone. In many quadrupeds the clavicles are absent or rudimentary, while in birds they are united in a single forked piece, popularly called the *merrithought*.

or *wishbone*. In many vertebrates below birds clavicles are recognized, but their homology is not always clear. The human clavicle is by some considered to be composed of its body, or clavicle proper, with a mesoscapular segment or acromial epiphysis, a precoracoid or sternal epiphysis, and an omosternum, or interarticular fibrocartilage; but this view is not generally adopted. The material resulting from the decomposition and consequent hydration of the feldspathic rocks, especially granite and gneiss, and of the crystalline rocks in general. As thus formed, it almost always contains more or less sand, or silicious material, mechanically intermixed. After this has been separated, the clay itself is found to consist of a hydrated silicate of alumina, but it is not yet positively made out that there is one definite combination of this kind constituting the essential basis of all the substances to which the name *clay* is applied. All clays contain hygroscopic water, which may be expelled by heating to 212° F.; but they also contain water in chemical combination, and when this is driven off by ignition the clay loses its plasticity, which cannot be restored. Ordinary clay contains more or less lime and other impurities, which render it to a certain extent fusible. The purer varieties are refractory, and are known as *fire-clay* (which see). (See also *pipe-clay*, *china-clay*, *porcelain-clay*, and *kaolinic*.) The plasticity of clay is of great importance, as without this quality it could not be easily worked into the various shapes for which it is used. On what condition it depends has not as yet been clearly made out.

2. Earth in general, especially in the Scriptures, as the material from which, according to the account in Genesis, the body of the first man was formed.

a subdivision of the Jurassic series, named from the county in England where it is conspicuous. It is the upper one of two sections into which the Oxfordian is divided, the lower one being the Kelloways rock (Callovian). The Oxford clay crops out in England from Dorsetshire through to Yorkshire. It consists mainly of layers of stiff blue clay, and sometimes attains a thickness of 600 feet.—**Potters' clay**, a clay suitable for making the coarser varieties of pottery, or for being worked by the potter.

It consists essentially of carbonate of iron more or less mixed with clay and sand, and often has the form of nodular concretionary masses. It contains from 20 to 50 per cent. of metallic iron, according to its purity.—**Clay marl**, a whitish, smooth, chalky clay.—**Clay pigeon**, a saucer of baked clay used as an artificial flying target in trap-shooting.—**Clay rock**, a rock made up of fine argillaceous detrital material, and chiefly that derived from the decomposition of the feldspars; indurated clay; clayey material sufficiently hardened to be incapable of being used as clay without grinding, but not chemically altered or metamorphosed.—**Clay shale**, clay having a thinly laminated structure. It differs from clay slate, or argillaceous schist, in that the latter has undergone more or less metamorphism, and from this cause has become crystalline and schistose in structure.—**Clay slate**, an argillaceous rock characterized by having a slaty or fissile structure. It consists of detrital or fragmental material which has become consolidated into a rock, and has undergone more or less rearrangement of its constituent particles. (See *metamorphism*, and *metamorphic rocks*, under *metamorphic*.) Roofing-slate is the most characteristic form of clay slate. The tendency of this rock to split into thin plates, making it available for roofing, is ordinarily the result of conditions arising after its deposition and consolidation (see *cleavage*, 3); sometimes, however, this structure is that of the original deposit. Clay slate, or argillaceous schist, often passes gradually into mica schist, and appears to be an incipient stage in the formation of that rock.

They are too large to have been commonly worn as ornaments, and their use is uncertain. The water from the clay drives the molasses before it, and soon changes it into a saturated solution of pure sugar by dissolving some of the crystals. As the water filters through the loaf it expels the mother-liquor, and the brown color descends toward the point of the loaf and disappears.
